### Description

Monkey D. Luffy, on his journey of becoming the "King of Pirates" and to conquer the "One Piece", wants to travel across the Grand Line. Grand Line is a mysterious sea, and is in the shape of a  $N * M$  grid  $S$  with each cell denoting the wind direction. The sign of  $S[i][j]$  can be:

- 1 which means wind in the cell flows to the right. (i.e from  $S[i][j]$  to  $S[i][j + 1]$ )
- 2 which means wind in the cell flows to the left. (i.e from  $S[i][j]$  to  $S[i][j - 1]$ )
- 3 which means wind in the cell flows downwards. (i.e from  $S[i][j]$  to  $S[i + 1][j]$ )
- 4 which means wind in the cell flows upwards. (i.e from  $S[i][j]$  to  $S[i - 1][j]$ )

Notice that there could be some signs on the cells of the grid  $S$  that point outside the Grand Line sea grid.

- Luffy's ship "Merry" can only sail along the wind direction and can't go outside the Grand Line sea grid  $S$  at any point.
- Luffy can also modify the wind's direction on a cell with  $cost = 1$ . ( can modify the sign on a cell one time only )

Find the minimum cost to make Luffy's Voyage from the top left corner of the Grand line i.e  $S[1][1]$  to its bottom right corner i.e  $S[N][M]$  possible.

### Input Format

Input is given from Standard Input in the following format:

$N$   $M$   
 $S_{1,1} \dots S_{1,M}$   
:  
:  
 $S_{N,1} \dots S_{N,M}$

### Output Format

Print the answer.

### Constraints

$2 \leq N, M \leq 1000$
